

GRIEVING

Where to go when you're looking for help

What is grief?

Grief is a natural and necessary reaction to loss. People can experience grief when a person or pet dies, but grief can also be felt after any important loss, like the loss of a job, relationship or independence from a disability. It is also common to feel grief after being diagnosed with an illness or health problem.

Grief can cause strong, and sometimes overwhelming, feelings. Normal symptoms of grief can be similar to those of depression, except that these symptoms normally pass within a few months of the loss.

Grieving can also cause a range of reactions. People often say they feel numb for the first month after a loss, when they have difficulty feeling any emotion. Or they may feel relief if the person who died has been suffering. Grieving can also elicit a stabbing pain that lessens, but doesn't completely disappear, with time.

Elisabeth Kubler-Ross identified five stages of grief: denial, anger, bargaining, depression and acceptance. These stages aren't felt in any specific order, and they aren't the same for each person. People don't have to experience each stage, but if they do, how long and intensely they experience each stage will vary.

What are some options?

Many people process grief with the support of loved ones and other strategies for self-care. But some people many need extra support from a mental health professional. Grief counselling helps people through the unique difficulties of grief. Peer support groups and family therapy may also be helpful.

Bereaved Families of Ontario – Toronto

250 Merton St., Toronto, ON

www.bfotoronto.ca

416 440-0290

info@bfotoronto.ca

If any of this information is incorrect or outdated, or if there are additional organizations or programs that would be helpful to include, please e-mail the information to us at access.resources@camh.ca.

This resource list is for information purposes only and does not constitute an endorsement by CAMH or guarantee any particular outcome.
